

MIDTERM GAME PROJECT FEEDBACK

1. Upload the zipped project here - only a .zip file format is accepted

36 / 40 points

 ITP1-Midterm%20Coursework%20Submission.zip

Grading Rubrics

Game Character Interaction & Rendering

The game character should do the following:

- Move left, right, jump left, jump right, jump up with appropriate key presses and releases
- Fall at a reasonable speed, stopping at the ground level after jumping
- Prevent double jumping
- Be anchored about its bottom centre
- Render with distinct graphical states for default state, isLeft, isRight, isFalling, isFalling && isLeft, isFalling && isRight
- Render with sufficient graphical detail and be coherent between its different graphical states.

Deduct 1 mark for a minor error in any category (e.g. one graphical state is the same as another) , 2 marks for a major error (e.g. graphical states have not been implemented). Give 0 for no implementation. Please explain the deductions in the comment box below

Score:

3 out of 5 points

- 2: Continuous holding of the jump key will cause the character to execute continuous upward movement.

Collectable Interaction (5)

The collectable should do the following:

- Have an object as its data structure with x, y, and an isFound property which defaults to false
- Be rendered with sufficient detail (not just a single shape)
- Be correctly anchored about its centre
- isFound should be set to true when the character is within a close range
- The collectable should not be rendered once isFound is true

Deduct 1 mark for a minor error in any category (e.g. collision detection range is too wide), 2 marks for a major error (e.g. collision detection not implemented). Give 0 for no implementation. Please explain the deductions in the comment box below

Score:

4 out of 5 points

- 1, The collectable is a simple form.

Canyon Interaction (5)

The canyon should do the following:

- Have an object as its data structure with an x property and a width
- Be correctly anchored about its top left hand corner
- The game character should interact with the canyon:
 - Falling down it when it collides with the canyon at ground level
 - It should fall at a rate faster than normal falling
 - Jumping over the canyon without plummeting
 - Should not be able to move once it has fallen down a canyon

Deduct 1 mark for a minor error in any category (e.g. game character can jump out the canyon), 2 marks for a major error (e.g. collision detection not implemented for the canyon). Give 0 for no implementation.

Please explain the deductions in the comment box below

Score:

5 out of 5 points

Anchoring of background objects (5)

Inspect the anchoring of trees, mountains and clouds. All items should be anchored in a sensible manner.

Deduct 1 mark for minor anchoring errors (e.g. anchor position appears slightly offset from object) and 2 marks for major anchoring errors (e.g. very wide anchoring, irrational use of variables or no variables used). Give 0 for no implementation. Please explain the deductions in the comment box below

Score:

5 out of 5 points

Initialisation of data structures (5)

Inspect the anchoring of trees, mountains and clouds. All items should use the prescribed data structures.

- Trees_x should be an array of numbers
- Mountains should be an array of objects with at least x_pos and one other property
- Clouds should be an array of objects with at least x_pos and one other property
- Each array should contain at least 3 items

Deduct 1 mark for minor errors (Eg. only two items in an array) and 2 marks for major errors (eg. object with arrays used instead of array of objects). Please use discretion for more advanced data structures such as constructor functions and classes. Give 0 for no implementation. Please explain the deductions in the comment box below

Score:

5 out of 5 points

- The values of objects within an array (mountains and clouds) can be accessed directly without the need for explicit iteration.

Traversal using for loops (5)

Inspect the for loops rendering trees, mountains and clouds. All for loops should conform to the following

- Loops should traverse the array dynamically (i.e. using the length property)
- Loops should access the data in the arrays to render the objects (i.e. not using global variables)
- Local variables should be declared
- All loops must be guaranteed to terminate

Deduct 1 mark for minor errors (e.g. implicitly declared variables) and 2 marks for major errors (e.g. no for loop used). Please use discretion for more advanced techniques e.g. "for of" or "for each" loops. Give 0 for no implementation. Please explain the deductions in the comment box below.

Score:
5 out of 5 points

Scrolling Implementation (3)

- Scrolling should be implemented with push, pop and translate.
- All rendering except the ground should happen within push and pop statements
- The camera should follow the game character as they move keeping them in the centre of the screen but moving all other items in the opposite direction to create the illusion of movement

Deduct 1 mark for minor errors (e.g. not all items are included in scroll) and 2 marks for major errors (e.g. wrong method used resulting in poor functionality). Please use discretion for more advanced techniques such as 2D scrolling or parallax effects. Give 0 for no implementation. Please explain the deductions in the comment box below.

Score:
3 out of 3 points

Code quality (6)

Inspect the code for the following:

- Use of Indentation
- Vertical whitespace
- Declaration and initialisation of variables
- Naming of variables
- Use of comments
- Redundant code (e.g. unused variables, over complex logic, blocks of commented-out code)

Deduct 1 mark for minor errors (e.g. a couple of indentation errors) and 2 marks for major errors (e.g. indentation is wrong throughout the submission). If the submission is minimal (i.e. just a template) then give 0. Please explain the deductions in the comment box below.

Score:
5 out of 6 points

-1, The utilization of vertical white space is non-uniform.

Submission organisation

- | | |
|---|--|
|  | zip format, missing assets, deeply nested folder structure |
| 0 points | |
|  | well organised submission with all assets present |
| 1 point | |

2. Please upload your code in text format (not screenshots) in a PDF file here. Please clearly label with start and end comments exactly which sections of code you personally wrote without assistance. 5% of the marks for this coursework are reserved for this part.

 ITP1%20Game%20Project%20Coursework%20Code.pdf

Grading Rubric

In the PDF, is all student code included in a text format (not screenshots) and is it clearly labelled which code the student personally wrote?

Not clearly labelled and/ or code is not in text format

0 points

Clearly labelled and in text format

2 points

Overall Assessment Evaluation

Please use this space to provide feedback for the submission as a whole. Use the following guidelines to structure your feedback:

Strengths of the submission: Identify the strengths of the submission, including any particularly effective elements or approaches.

Areas for improvement: Highlight areas where the submission could be improved, including specific suggestions for enhancement.

If this is part of a larger project, or has a **follow-on submission**, provide advice on how to refine and strengthen the work to enhance the chances of success for the final coursework submission.

The code demonstrates a good understanding of the core concepts, and the character design is well-executed. To further enhance your work, consider the following: * Implement controls to prevent continuous jumping by the character. * Refine the design and implementation of the collectable objects. These refinements will help your code more fully meet the assignment criteria. I wish you the best of luck on your next assignment.
